AUTHOR: Pototskiy, I.N., Engineer
TITLE: On Explosions in Separation Shafts
PERIODICAL: Energetik, 1959, Nr 6, p 6 (USSR)

ABSTRACT: During the first months of exploitation of TF-170 boilers fired with pulverized peat, installed in an unidentified TETs, there were observed recurrent bangs in the separation shafts, which, in some cases, were as violent as explosions. An examination of the shafts revealed considerable damage to the lining and to the steel sheet elements. It was found that the bangs were caused by explosions of fuel dust accumulating in the corners and on the wrongly installed sides of the embrasure covers, which, instead of being placed at 60°, were placed at 40° and 50°. The angles of their inclination were rectified, the stiffening rib was

Card 1/2

On Explosions in Separation Shafts

SOV/91-59-6-3/33

strengthened with Nr 16 channel iron and the free fitting of the steel sheet was eliminated by application of chamotte concrete. After these readjustments, the boilers have been in exploitation for one year without trouble in their separation shafts.

TITLE:

The Steam-Blast Cleaning of the Furnace of a TP-170 Boiler
(Obduvka topki kotla TP-170)

PERIODICAL:

Energetik, 1958, Nr 10, pp 9 - 10 (USSR)

ABSTRACT:

Brown coal from the Moscow Basin is periodically burned in the TP-170 boilers of one thermo-electric power station (TETs) which were intended for burning milling peat. When this is done, excessive scorification of the furnace takes place. This is due to the fact that for milling peat, the furnaces of these boilers have ignition zones 4 meters high. When the coal is burned, lumps of slag are deposited on these zones, become detached from the baffles, and strike the cold funnel, thus inhibiting the working run of the boiler. To prevent this happening, steam-blast cleaning by the Perel'-man system of the corresponding sections of the side baffles has been successfully incorporated in two of these TP-170 boilers. The author describes this system, and concludes by saying that when the boiler is under a load of 100-130 tons per hour, steam-blast cleaning can be carried out once

Card 1/2

The Steam-Blast Cleaning of the Furnace of a TP-170 Boiler SOV-91-58-10-4/35

or twice per shift; with a load of 150 - 170 tons per hour steam-blast cleaning must be carried out 3 times per shift. Each steam-blast cleaning operation consumes 150 kg of water.

ABSTRACT:

The Physiological Institute Pavlov organized its second conference on problems of endocrinology. (The first took place in 1953 and dealt with problems connected with the treatment of the glands of internal secretion by means of cortison). It was said that in the course of the past three years better coordination and cooperation between physiologists and endocrinologists has been attained. Much interesting research work was carried out, in particular by the investigation of the part played by neurohumoral and endocrine factors in the nervous system both in a normal and in a pathological state. There follows a short description of special research work carried out in some cases. The conference decided that research work concerning the influence exercised by humoral factors and vitamins

TITLE: The Prehistoric Population of the Moscow Oblast' - Based on Paleolithic Studies Made in 1952-1957 (Doistoricheskoye naseleniye Moskovskoy oblasti - po dannym paleoliticheskikh issledovaniy 1952-1957 gg.)

PERIODICAL: Byulleten' Moskovskogo obshchestva ispytateley prirody - Otdel geologicheskiy, 1958, Nr 2, 1958, p 161 (USSR)

ABSTRACT: From 1952 to 1957, the author made Paleolithic studies in the basins of the Oka and Moskva rivers and their tributaries in the Moscow Oblast', the Mozheyskiy, Ruzskiy, Zvenigorodskiy, Kashirskiy and Ramenskiy rayony. Several Lower Paleolithic sites and finds of flint were discovered. Remainders of large mammal fossils of the Quaternary fauna were found in some of them. In this connection, the author mentions the names of two scientists who devoted their research studies to this subject: I.G. Pidoplichko and V.I. Gromov. The author states that his findings prove, without

TITLE: Device for converting seismograms into variable height recordings. Class 42,
No. 189165

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 23, 1966, 77

TOPIC TAGS: seismograph, seismologic instrument

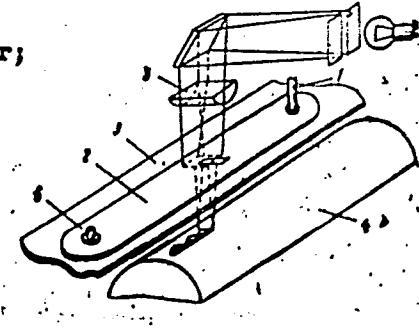

ABSTRACT: This Author Certificate presents a device for converting seismograms into variable height recordings, which contains a pantograph, an illuminator, and a photodrum. To increase the rate of processing seismograms, a drive pin coupled with a movable screen is mounted in the pencil socket of the pantograph (see Fig. 1). The illuminator and a rod which is the axle of rotation of the movable screen are mounted on a plate which can be moved along the generatrix of the photodrum.

TITLE: Magnetohydrodynamic description of a plasma

PERIODICAL: Zhurnal tehnicheskoy fiziki, v. 32, no. 6, 1962, 649 - 656

TEXT: A multi-component plasma is described by the single-liquid magnetohydrodynamic equations of motion for each of the components. Ohm's law is derived for both equal and different velocities of the individual plasma components. In particular, a plasma having three components variously combined is dealt with. The energy dissipation as depending on the magnetic field is examined.

✓ 3206. USE OF THE TSIATIN-SIV INSTRUMENT FOR ANALYSIS OF GASEOUS HYDROCARBONS BY LOW TEMPERATURE RECTIFICATION. Polzovskiy, L.A., Barinov, E.M. and Ivanenko, V.N. (Moscow: Gostoptekhnizdat, 1955). "Methods of Examining Petroleum and Petroleum Products", 164-174; abstr. in

Ref. Zh. Khim. (Ref. J. Chem., Moscow), 1956, 36(23). The instrument developed is an improved modification of the semi-automatic Tsiatin-SIV for the analysis of gaseous hydrocarbons by rectification at low temperatures. It preserves the basic constructive advantages over other instruments with smaller sizes: (a) the collection of fractions in graduated receivers with salt solution allows them to be easily removed for analysis since the fractions do not have to be pumped out with a forced pump as in other types of instruments; (b) the graduated receivers allow an additional measurement (besides the automatically traced diagrams) of the quantity of fractions obtained on distillation, which increases the reliability of the analytical results; (c) mercury is used in the instrument only in connectors, which is a great advantage as compared with older automatic and semi-automatic instruments.

TITLE: Seismicity of the territory of the Rumanian People's Republic over 1901-1960

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 1, 1962, 15,
abstract 1G86 (Izv. AN MoldSSR, 1962, no. 4, 68-90
(summary in Mold.))

TEXT: Positions of the foci, intensities (in points) and magnitudes have been determined for 128 earthquakes from instrumental data collected in Rumania between 1908 and 1960. The Carpathian region appears to be the most active seismically and is associated with the epicenter of the strongest Rumanian earthquake on November 10, 1940 (M = 7.4, intensity at epicenter IX-X points). Another characteristic of this region is that in the majority of cases the foci are situated at a depth of ~ 150 km. This region is in the zone of the sharp folding of the Carpathian arc (the Vrancea region). Many epicenters are also found outside Vrancea: the depth of foci.

Card 1/3

S/169/63/000/001/032/062

Seismicity of the territory ...

is here < 100 km. The magnitude of the deep earthquakes (M) in the Carpathian region is determined by the logarithm of the ratio of maximum amplitude in phase S to the period. The relation between M and the intensity expressed in points on the Mercalli-Cancani scale is $M = 0.51 I_0 + 2.55$. The frequency graph of earthquakes in the Carpathian region over the period 1937-1958, for $M \geq 5.5$, is curvilinear with a slope of $0.52 - 0.58$ in the central position. According to energy characteristics of the earthquakes the Carpathian region may be divided into 2 zones. The total seismic energy liberated in the Rumanian earthquakes is $\sim 10^{25}$ ergs, almost 40% of which is accounted for by the earthquakes of 1940. Mean annual energy evolved in this way appears fairly constant, although considerable deviations were observed in 1940 and 1945. According to instrumental data, apart from the Carpathian region a few other active areas exist in the territory of Rumania: the Banat region (Timisoara) is characterized by strong earthquakes with M up to 5 (VIII points at epicenter). Macroseismic and instrumental data are generally in agreement: the former indicate however a few

Card 2/3

S/169/63/000/001/032/062
D263/D307

Seismicity of the territory ...

additional zones, where V-VI point earthquakes do occur. Strong quakes in Yugoslavia and Bulgaria may be detected on Rumanian territories with a force of VII points, while the earthquakes at Dobrudzha may even reach VIII points. Seismic surveying of Rumania was performed chiefly on the basis of data concerning the 1940 earthquake. A portion extending in the north-western direction, where the intensity exceeded VIII points, was observed in the epicentral zone of this earthquake.

TITLE: Effect of tungsten on the determination of molybdenum by the thiocyanate method

SOURCE: Zhurnal analiticheskoy khimii, v. 21, no. 2, 1966, 182-186

TOPIC TAGS: tungsten, molybdenum, thiocyanate, quantitative analysis, oxidation reduction reaction

ABSTRACT: The dependence of the rate of electrolytic reduction of molybdenum on the Mo:W ratio in solution was studied at 20 ± 0.5°C in connection with the quantitative determination of molybdenum with thiocyanate in the presence of tungsten. In strongly acidic media, hexavalent molybdenum was found to react with tungsten to form compounds whose composition depends on the acidity of the solution and proportions of the components. The rate of molybdenum reduction bound in such a state is higher

UDC: 543.70

Card 1/2

L 23141-66
ACC NR: AP6006939

than that of free molybdenum. This promotes the reduction of Mo(V) to Mo(III), which accounts for the low results obtained in the thiocyanate determination of Mo when SnCl_2 is used as the reductant. The influence of such impurities as tungsten, aluminum, and others (i, e., ions capable of forming heteropoly compounds with Mo in acid media) on the thiocyanate determination of Mo cannot be avoided by lowering the oxidation-reduction potential of the reductant; it is necessary to introduce competing complex-forming agents. Most promising in this respect appear to be those reductants which combine both of these properties (thiourea, ascorbic acid). Orig. art. has: 3 figures, 2 tables.

AUTHOR: Lebedeva, L. I.; Potrokhov, V. K.

TITLE: The problem of determining molybdenum in the presence of tungsten by the thiocyanate method

v1

SOURCE: Leningrad. Universitet. Metody kolichestvennogo opredeleniya elementov (Methods for the quantitative determination of elements). Leningrad, Izd-vo Leningr. univ., 1964, 55-61

TOPIC TAGS: molybdenum determination, thiocyanate method, photometric analysis, tungsten cathode, stannous chloride, ascorbic acid

ABSTRACT: The colorimetric determination of molybdenum from the optical density of thiocyanato-molybdenum (V) complexes was studied in the presence of tungsten salts to establish optimum conditions for eliminating the effect of tungsten. Optical densities were measured in solutions reduced by various chemical agents or electrolytically on a tungsten cathode. The decrease in optical density of the complex was shown to depend only on the presence of W(V) and to reach a maximum at 2:1 W(V)/Mo (V) ratios, as shown by isomolar test series and at constant molybdenum concentra-

Card 1/4

L-36733-65
ACCESSION NR: AT5007814

O

tion (see Fig. 1 of the Enclosure). The use of stannous chloride as a reducing agent was shown to be possible without impairing the accuracy of the results only if excessively large amounts of tungsten were not present; addition of large amounts of citric acid did not eliminate the effect of W ions; and addition of propyl alcohol was proved to inhibit the W(V)-Mo(V) interaction. The best results were obtained with weak reducing agents and particularly with ascorbic acid. The latter method resulted in 0.0-2.0% relative errors for determining 0.2-0.5 mg Mo at 1:20 to 1:100 Mo/W ratios. Orig. art. has: 4 figures and 3 tables.

AUTHOR: Potroshkov, V. A. 44/55

TITLE: A calorimeter for studying heat transfer between the ends of a cylindrical
gas layer 21.44.65

SOURCE: IVUZ. Priborostroyeniye, v. 8, no. 4, 1965, 115-118

TOPIC TAGS: calorimeter, convective heat transfer, thermocouple

ABSTRACT: The author describes a calorimeter designed for studying heat exchange
between the ends of a cylindrical layer of air for the case of free convection. A
diagram of the instrument is shown in fig. 1 of the Enclosure. A multilayer alumini-
num foil screen 11 is located in a cylindrical housing 5, which is 100 mm in dia-
meter and 120 mm long. The measuring element is located in the cavity of the hous-
ing. This element consists of a polished red copper disc 6 which is 0.5 mm thick
and has thermocouples fastened to it made of copper and constantan wires 0.12 mm in
diameter, a main heater 7 and a guard heater 9 which are made from constantan wire
0.25 mm in diameter, and a differential thermopile with 96 silver-constantan elec-
trode junctions. A multijunction differential thermocouple 8 is placed between the

Card 1/3

L 2940-66

ACCESSION NR: AP5021448

main and guard heaters. This thermocouple is a disc of radioactive porcelain with sintered-in silver electrodes to which constantan wires 0.07 mm in diameter are soldered. The thermocouple junctions are located on both surfaces of the disc, which is 3-4 mm thick. A measuring element with a diameter of 40, 50 and 60 mm is mounted on tube 12 through which connecting wires 14 are passed for hooking the apparatus to the electrical circuit. The heat is transmitted to disc 4 which is made of polished aluminum and placed between gaskets 3. The disc is cooled by water which is fed through one of the connecting pipes 1 in the cover 2. The temperature of this disc is also measured by a thermocouple. The distance between the heated and cooled surfaces is determined from the reading of gauge 13, and can be varied from 0 to 100 mm. A special regulator is used for controlling the power to the guard heater. This device is described and a schematic diagram is given. The calorimeter is designed so that it can be rotated through an angle of 90° with respect to the horizontal axis. Orig. art. has: 2 figures.
